

A termination of a tension member (1) for use as a tension leg for a tension leg platform. The tension member (1) consists of a plurality of carbon fiber filaments gathered into one or more strands (2) in which the filaments run close together. Around the strands is provided a sheath. The bundles/strands (2) are spread apart in a transitional zone, and each bundle/strand is inserted into its respective hole (6) in a socket (4, 5), and is fixed in relation to the hole (6) by means of a hardenable mass.
